Ishimaru M., Hiraoka K., Honda C.;

"A myb-related gene of the Kyoho grape (Vitis labruscana)
anthocyanin biosynthesis in grapes.";
Submitted (OCT-2001) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).
-!- SIMILARITY: CONTAINS 2 MYB-LIKE DOMAINS.

The ANT1 polynucleotide can be used for modifying the expression of a native plant gene, particularly for producing an anthocyanin 1 phenotype in plants, which is responsible for many red and blue colours in plants. The polynucleotide is useful for modifying e.g. leaf colour, flower colour or fruit colour in plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide derived from tomato, useful for producing an Anthocyanin 1 phenotype in plants, particularly for modifying e.g. leaf color, flower color or fruit color in plants

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nutritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify phrenyl lipid content, to modify fatty acid and modify wax content. They may also be used to alter seed characteristics such as shelf-life, size, stress
                                                                                                                                                                Agriculture; metabolic chemical; environmental stress; drought; microbial disease resistance; herbicide resistance; seed yield; fruit yield; growth rate; leaf senescence; flower senescence.
                                                                                                                                                     plant; transcription factor;
                                                                                                                                                                                                                                                          02-JUL-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tolerance, seedling vigour, pest and pathogen resistance and germination rate. They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a plant's traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          transcription factor G663. The transcription factors may be used to modify traits associated with structural or developmental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acids encoding plant transcription factor polypeptides, for altering the developmental and structural characteristics oplants, e.g. corn, potato and cotton plants -

                                                                                                                                                                     homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that encodes a polypeptide or annisense nucleic acid, inserting the polynucleotide or annisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower sensecence and many other traits listed in the specification). The present sequence is one of the 232 proteins which are
                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant

                                                                                                                                                                                              tolerance, seedling vigour, rate. They may also be used transcription factor levels
                                                                                                                                                                                                                                  characteristics of plants, e.g., corn, potato and cotton plants, when their expression level is altered. Specifically, they are used for modifying the nucritional content of plants or seeds, e.g., to modify vitamin and mineral content, to modify the oil content of seeds, to modify the insoluble sugar content of seeds, to modify phremyl lipid content, to modify fatty acid and modify wax content. They may also be used to alter seed characteristics such as shelf-life, size, stress
                                                                                                                                                                                                                                                                                                                    The present sequence is homologue G2422 of Arabidopsis thaliana transcription factor G663. The transcription factors may be used to modify traits associated with structural or developmental

produce a transgenic

Claim 40; Page 880-881; 941pp; English

cc are a transgenic plant comprising the polynucleotides, a computer creadable medium having stored sequence information, and identifying a commologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynucleotide is used for producing a plant having a comprising selecting a plant having a complete trait, the method comprising selecting a polynucleotide that encodes a polypeptide or an antisense nucleic acid, inserting the polynucleotide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased plant, and selecting for a modified trait (e.g. increased plant, and selecting for a modified trait (e.g. drought), microbial disease resistance, herbicide resistance, seed and fruit yield, growth encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included The invention relates to 1 of 232 isolated or recombinant polynucleotides senescence and

                                                                         The present sequence represents a plant stress tolerance-related myloblastosis (MYB) transcription factor. The specification describes AtMYB60, AtMYB764, AtMYB75 and AtMYB90. MYB polypeptides are useful fo enhancing a plant's tolerance or sensitivity to stress e.g. salt, drought, cold and heat tolerance. It is also useful for producing a transgenic plant with enhanced stress tolerance or stress sensitivity. MYB polypeptides are also useful for increasing the production of products of the phenylpropanoid biosynthesis pathway, e.g. stilbenes, derivatives in a salicylic acid, anthocyanins, and phenolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       as shelf-life, size, stress tolerance, seedling vigour, pest and pathogen resistance and germination rate. They may also be used in gene therapy. Therefore manipulating transcription factor levels in plants offers great potential in agricultural biotechnology for modifying a

The invention relates to 1 of 232 isolated or recombinant polynucleotides CC encoding an Arabidopsis thaliana transcription factor, their variants, CC complements, fragments, or related polynucleotide with 31% to 95% CC complements, fragments, or related polynucleotide with 31% to 95% CC sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered compared to a wild-type or reference plant, or the plant CC phenotype as compared to a wild-type or reference plant, or the plant CC exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included CC are a transgenic plant comprising the polynucleotides, a computer CC readable medium having stored sequence information, and identifying a homologue sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information. The isolated or recombinant polynucleotide is used for producing a plant having a modified trait, the method comprising selecting a polynucleotide that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          WPI; 2002-292022/33

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC 1. PAP1 and PAP2 are MYB-like transcription factors that regulate the CC production of anthocyanin pigment. The nucleotide sequence of the CC invention is useful for screening for PAP gene expression, it is also CC useful for detecting promoter activity within a plant cell. The nucleotide sequence is also useful for screening for plant cells are then used to produce transgenic plants with tissue-specific altered colour carpression. The nucleotide sequence is also useful for enhancing CC expression. The nucleotide sequence is also useful for enhancing CC expression of phenylpropanoid product in a plant. A transgenic CC plant is useful for detecting a stress condition such as light CC stress, water stress, PH stress, temperature stress, heavy metal CC stress, pathogen attack or infection, wounding, nutrient deficiency, CC herbivory, or abnormal hormone levels in a plant. PAP1 or PAP2 colouration in ornamental plants for commercial sales, and for sensitising plants to stress. Introduction of PAP2 ensitises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The present sequence represents the A. thaliana PAP2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to the nucleotide and protein sequences of novel Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAPI or PAP2. The genes for both PAP1 and PAP2 have been mapped to chromosome 1. PAP1 and PAP2 are MYB-like transcription factors that regulate the
Determining whether one of several test transcription factor polynucleotides encodes pathway TF by determining expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAE30046 standard; Protein; 249 AA

It is also useful for identifying one or more transcription factors that activate one or more genes of a biological pathway of a plant, fungi or animal cell, where the biological pathway can be a biochemical pathway such as biosynthetic pathways for soluble and insoluble carbohydrates, for amino acids and a response pathway to abiotic stress such as cold, freezing, drought, heat, nutrient deficiency, pH or biotic stress such as fungal, viral or bacterial infection, developmental pathway such as flowering, root development, a response pathway to environmental cues such as light intensity and light quality, circadian rhythm. Sequences of the invention are used to generate transgenic plants. The present sequence is Arabidopsis thaliana G663 transcription factor protein.
                                                                                                                                                                                                                                                                                                                                                                              polynucleotides encodes a biosynthetic pathway transcription factor or a primary metabolite pathway gene or a secondary metabolite pathway gene such as a terpenoid or alkaloid pathway gene transcription factor. It is also useful for determining whether a member of a pool of test encodes a Mentha sp. or Taxus sp. terpenoid pathway gene where the terpenoid pathway gene encodes limonene synthase (LS) or taxadiene synthase (TDS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        pathway gene promoter linked to reporter gene in a cell in presence of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 expression of one or more genes in a pathway. The method is useful for determining whether a member of a pool of test transcription factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a high-throughput method for identifying a polynucleotide which encodes a transcription factor for controlling the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a plant stress tolerance-related myloblastosis (MYB) transcription factor. The specification describes AtMYB60, AtMYB764, AtMYB75 and AtMYB90. MYB polypeptides are useful foenhancing a plant's tolerance or sensitivity to stress e.g. salt, drought, cold and heat tolerance. It is also useful for producing a transgenic plant with enhanced stress tolerance or stress sensitivity. MYB polypeptides are also useful for increasing the production of products of the phenylpropanoid biosynthesis pathway, e.g. stilbenes, flavonoids, lignins, salicylic acid, anthocyanins, and phenolic

controlled sequence from a database comprising a plurality of known plant sequences comprising inputting sequence information selected from one of 464 fully defined sequences given in the specification. The isolated or recombinant polynuclectide is used for producing a plant having a modified trait, the method comprising selecting a polynuclectide that encodes a polypeptide or an antisense nucleic acid, inserting the polynuclectide or antisense nucleic acid into an expression vector, introducing the vector into a plant or a cell of a plant to overexpress the polypeptide or antisense nucleic acid, thereby producing a modified plant, and selecting for a modified trait (e.g. increased plant, and selecting for a modified trait (e.g. increased production of agriculturally useful proteins or metabolic chemicals, pest tolerance, environmental stress response (e.g. drought), microbial classes resistance, herbicide resistance, seed and fruit yield, growth rate, leaf and flower senescence and many other traits listed in the specification). The present sequence is one of the 232 proteins which are
                                                                                                                                                                                                                                                                                                                                                       encoding an Arabidopsis thaliana transcription factor, their variants, complements, fragments, or related polynucleotide with 31% to 95% sequence identity, where the plant possesses an altered trait as compared to a wild-type or reference plant, or the plant exhibits an altered phenotype as compared to a wild-type or reference plant, or the plant exhibits ectopic expression or altered expression of one or more genes associated with a plant trait as compared to a wild plant. Also included are a transgenic plant comprising the polynucleotides, a computer readable medium having stored sequence information, and identifying a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A. thaliana) transformation. The transformed plant cells are then used to produce transgenic plants with tissue-specific altered colour expression. The nucleotide sequence is also useful for enhancing accumulation of phenylpropanoid product in a plant. A transgenic plant is useful for detecting a stress condition such as light stress water stress on a stress condition such as light
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   stress, water stress, pH stress, temperature stress, heavy metal stress, pathogen attack or infection, wounding, nutrient deficiency, herbivory, or abnormal hormone levels in a plant. PAPI or PAP2 overexpression can also be useful in developing or enhancing desirable colouration in ornamental plants for commercial sales, and for sensitising plants to stress. Introduction of PAPI or PAP2 sensitises sensitising plants to stress. Introduction of PAPI or PAP2 sensitises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to the nucleotide and protein sequences of novel Arabidopsis thaliana production of anthocyanin pigment (PAP) genes PAP1 or PAP2. The genes for both PAP1 and PAP2 have been mapped to chromosome 1. PAP1 and PAP2 are MYB-like transcription factors that regulate the production of anthocyanin pigment. The nucleotide sequence of the invention is useful for screening for PAP gene expression, it is also useful for detecting promoter activity within a plant cell. The nucleotide sequence is also useful for screening for PaP1 are the legitary transferred to the contract of the contract 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             plants to respond more quickly to a stress condition in ways that are physiologically significant, as well as in ways of ornamental significance. The present sequence represents the A. thaliana PAP1 protein sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated PAP1 or PAP2 gene, useful for increasing pigmentation plants, as reporter genes for analysing expression pattern of promo of interest, and to increase flux through phenylpropanoid pathway
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         transcription in a plant involves introducing into the plant a recombinant expression cassette comprising a promoter that is operably linked to a heterologous polynucleotide encoding a MYB protein, especially GhMYB 1 or GhMYB 6. The plant is especially a cotton plant, and the promoter directs expression of the polynucleotide in cotton fibres or rects expression be conferred on the plant by this method, e.g. increased fibre quality, yield, length, strength or fineness, alteration of root
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Modulating transcription in plants for improving cotton fiber quality, comprises introducing a recombinant expression cassette comprising a promoter operably linked to a sequence encoding a MYB polypeptide -

                                                                                                                                                                                                                                                        The present invention relates to novel plant transcription factors from Eucalyptus grandis or Pinus radiata. The present sequence is one such transcription factor. The transcription factor may be used to produce a plant having modified gene expression such as a woody plant e.g. a eucalyptus, pine, acacia, poplar, sweetgum, teak, or mahogany species or to modify the activity of a polypeptide in a plant. The transcription factors of the present invention are members from the following families of regulatory proteins: ball, ball, ball, family of G-box binding factors, basic helix-loop-helix zipper, homeotic/homeodomain/homeobox/MADS, homeodomain zipper, LIM domain, AP2 and EREBS, zinc finger domains of type 2 Cys2His2, CCAAT box elements and MYB.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polynucleotide encoding a plant transcription factor for producing a plant e.g. a woody plant, preferably eucalyptus or pine, having modified gene expression or modified activity of a polypeptide
                                                                                                                                                                                                                       Sequence
